Research Experience

Vanderbilt University - Graduate Teaching Assistant (Aug 2017 –)
Teaching assistant for class of ∼250 students
Research radius inflation in low-mass star possibly originating from magnetic activity within convective layers
Develop simulations of star clusters involving binary star dynamics, and stellar evolution to understand role of binary star perturbation in formation of blue straggler stars

Vanderbilt University - Graduate Research Assistant (Aug 2015 – Aug 2017)
Discovered possible binaries in young nebulous clouds through analysis of radial velocity variations
Investigated raw binary fractions as a function of age in young star forming regions
Developed Monte Carlo simulations to reconstruct true binary fractions using Bayesian Inference

University of Florida - Post-Baccalaureate Researcher (Aug 2013 – Jul 2015)
Developed statistical algorithm, the *Angular Dispersion Parameter* (ADP) to quantify sub-structure in star forming clusters
Applied ADP to Orion Nebula Cluster and older globular clusters to study systematics and biases
Studied sub-structure of 20 young star forming regions within MYStIX survey using ADP

Research Interests

- Nbody simulations of open clusters with binary star dynamics, and stellar evolution using the AMUSE software
- Spatial structure and kinematics of young star forming regions, focusing on star formation occurring within binary stars, and triple stars
- Computational astronomical analysis and statistics, specifically using Python, and R-code
